

Flight Booking Funnel Analysis – Product Analytics Case Study

Problem

Users search for flights on platforms like MakeMyTrip but a significant percentage do not complete the booking process. The objective is to identify where users drop off in the booking funnel and recommend product improvements to increase conversion.

Note: Dataset was simulated to model user behavior across the booking funnel for analytical purposes.

Funnel Overview

The user journey was divided into the following stages:

1. Search
2. View Flights
3. Select Flight
4. Payment
5. Booking Complete

Key Findings

- Overall booking conversion rate is approximately **15%**
 - The highest drop-off (~45%) occurs between **Select Flight → Payment**
 - A significant number of users exit at the payment stage, indicating friction in checkout
 - Mobile users are more likely to drop off compared to desktop users
 - Higher-priced options show increased abandonment, suggesting price sensitivity
-

Analysis & Insights

- Users demonstrate strong initial intent (high search volume), but conversion decreases sharply in later stages
 - The payment stage introduces friction due to multiple steps, manual data entry, and potential trust concerns
 - Mobile experience likely contributes to drop-offs due to slower load times and usability constraints
 - Price hesitation indicates users may be comparing alternatives before committing
-

Product Recommendations

1. Simplify Checkout Process

- Reduce number of steps in payment flow
 - Enable autofill for passenger details
 - Provide guest checkout option
- Expected Impact:** Reduce friction and improve conversion by **5–8%**
-

2. Introduce Price Confidence & Urgency Features

- Display messages like “Price likely to increase soon” or “X users booked this flight”
 - Highlight limited seat availability
- Expected Impact:** Reduce hesitation and increase conversions by **3–5%**
-

3. Optimize Mobile Experience

- Improve page load speed
- Minimize input fields and simplify UI

- Enable one-tap payment options

Expected Impact: Reduce mobile drop-offs and improve conversion by **4–6%**

Expected Impact

Implementing the above improvements is estimated to increase overall booking conversion by **10–15%**, particularly by reducing drop-offs at the payment stage.

Tools & Approach

- Data simulation using Excel
- Funnel analysis to identify drop-offs
- Basic visualization using charts
- Product thinking to derive actionable recommendations
